Diagram 1. Quantum 6000 Troubleshooting Key

3. Remove the motor brushes from the left motor and inspect them for wear or damage. **See figure 33.**
 - *If the motor brushes are worn below 0.25 in. or they are physically damaged, then replace the brushes and retest the system.*
 - *If the motor brushes are not worn below 0.25 in. and are not physically damaged, then replace the left motor (9) and retest the system.*

Flash Code #3 - Left Motor Wiring Fault

Symptoms:

There is a steady flash of three battery condition meter LEDs (red).

Diagnosis:

There is a wiring fault between the left motor (9) and the brake.

Solution:

Use the following procedure to find the source of the problem:

1. Unplug connector 9a from connector 2b. **See diagram 3.**
2. Measure resistance from pin 1 to pin 3, then pin 1 to pin 4 on connector 9a. **See figure 34.**
 - *If your multimeter indicates an open for both tests, then replace the power module (2) and retest the system.*
 - *If your multimeter indicates less than 1 ohm for either test, then replace the left motor (9) and retest the system.*

Flash Code #4 - Right Motor Disconnected

Symptoms:

There is a steady flash of four battery condition meter LEDs (three red, one yellow).

Diagnosis:

There is an open in the right motor (8).

Solution:

Use the following procedure to find the source of the problem:

1. Unplug connector 8a from connector 2d. **See diagram 3.**
2. Measure resistance from pin 1 to pin 2 on connector 8a. **See figure 35.**
 - *If your multimeter indicates an open, then go to the next step.*
 - *If your multimeter indicates about 0.5 – 1.5 ohms, then replace the power module (2) and retest the system.*
